CYBERAGENTS EXCHANGE

OCTOBER 2026

Find, fix and hunt PHP2Shell

Three CyberAgents Exchange skills, contributed by Tenable, for CVE-2026-109618 and CVE-2026-109619

THE THREAT

PHP2Shell at a glance

Two critical CVEs let an unauthenticated attacker run code on any PHP that serves web requests, from PHP-FPM to mod_php. Tenable Research published its FAQ on Oct 21, 2026.

9.2
CVSS v4.0
Both CVEs, no login needed

1.3M+
Exposed hosts
Internet-facing, may be vulnerable

Oct 17
First attempt seen
Four days before disclosure

8.1
No official fix
For 8.1 and older: upgrade

FIXED RELEASES

8.5.12 · 8.4.27 · 8.3.36 · 8.2.35

INTERIM ONLY, UNTIL YOU CAN PATCH

memory_limit=-1 and session.upload_progress.enabled=0, then restart every PHP worker

Source: Tenable Research PHP2Shell FAQ, Oct 21, 2026, citing Amazon Threat Intelligence and a rough estimate by Silas Cutler

THE RESPONSE

Find it, fix it, hunt for it

Three skills on the CyberAgents Exchange, all contributed by Tenable. Each one answers the question a team asks next.

STEP 1: FIND IT

Where are we exposed?

PHP2Shell Tenable Skill

Grades every asset against the fixed PHP releases from Tenable One data.

`/php2shell-tenable`

NEW ON THE EXCHANGE

CONTRIBUTED BY TENABLE

STEP 2: FIX IT

What do we fix first?

Remediation Priority & Impact Agent

Ranks PHP2Shell hosts by exposure and attack path, with Tenable's exact fix.

`/fix-today`

EXCHANGE INSPECTOR VETTED

CONTRIBUTED BY TENABLE

STEP 3: HUNT FOR IT

Were we hit before we patched?

SOC Hunter

Hunts for exploitation across SIEM, EDR and Tenable data, back to Oct 17.

STEP 1: FIND IT

PHP2Shell Tenable Skill

Built by Tenable, this skill pulls PHP2Shell findings and PHP inventory from Tenable One via Hexa AI MCP, grades every asset's exposure, and writes a remediation-ready HTML, PDF and CSV report.

Exposure answered in one command

Turns "are we exposed to PHP2Shell?" from a cross-team scramble into a graded, per-asset answer from your own Tenable data.

A report ready to hand off

Turns raw findings into an HTML, PDF and CSV report naming the ten worst assets and interim mitigations.

Per asset

Graded from Tenable One
VM, WAS and cloud inventory

Fix first

Remediation plan
Ten worst assets lead the list

Interim

Mitigations included
For hosts that can't patch

JSON

Agent-ready output
One step in a larger workflow

STEP 2: FIX IT

Remediation Priority & Impact Agent

PHP runs everywhere, and no team can patch it all at once. This agent answers "which PHP2Shell hosts do we fix today?" from live Tenable exposure data, as a ranked FIRST / NEXT / SOON plan.

Priority stops meaning severity

Ranks PHP2Shell hosts by Asset Exposure Score, confirmed exploitation and attack-path position.

The fix ships with the finding

Tenable's exact fix, or an interim mitigation where a host can't patch yet, batched into fewer change windows.

PHP2SHELL BY THE NUMBERS

9.2 **CVSS on every host**
Severity can't rank them

4 **Fixed PHP releases**
Tenable's fix, word for word

8.1 **No official fix**
For 8.1 and older: flagged

STEP 3: HUNT FOR IT

SOC Hunter

A patch closes the hole, not the question of whether it was used. Built by Tenable's security team, SOC Hunter runs a structured PHP2Shell hunt back to Oct 17.

Start from behavior, not IOCs

With no published IOCs, it hunts PHP workers spawning shells or writing new web files since Oct 17.

Every source, one session

Correlates SIEM web logs, EDR process trees and Tenable's vulnerable PHP hosts in one terminal session.

REAL THREATS CAUGHT

Surfaced true positives missed by automated detection, including an active insider threat, MFA bypasses, and critical cloud findings.

tenable®

GET STARTED

Run all three today

All three run in Claude Code. The first two read Tenable One through Tenable Hexa AI MCP, and SOC Hunter adds your own SIEM and EDR through MCP.
